A longitudinal study of the relationship between selected dental

---

occlusal traits and the 2- and 6-year growth of stature in white male children. Longitudinal changes in the size and shape of the face and dental traits have been found to be related to linear growth in children. However, the relationships between dental traits and growth rates of children have not been well studied. In the present study, multivariate

---

analyses were used to determine whether selected dental traits were related to the 2- and 6-year growth of stature in white male children. The subjects, 232 preadolescent children (111 boys and 121 girls), were examined for dental traits and other indices of the face and craniofacial complex at two time points. The result showed that

---

posterior tooth position (POP) and overjet (OJ) had significant negative relations with 2- and 6-year growth of stature, while overbite (OB) had a significant positive relation with 2-year growth of stature. These findings suggest that these dental traits, particularly OJ and POP, are related to the growth of stature in male

children. Hektor (son of Lycaon)  
Hektor or Hektoros (Greek: Ἡέτωρ,  
Hektor) was an Athenian, an  
abridger of laws and a poet. His life  
is not known. Hektor was probably  
the son of the Spartan Lycaon and  
himself the son of Athenian King  
Lycaon, who were exiles from  
Athens (cf. Antipater of Tarsus, *De
